电致变色tpl1401driver

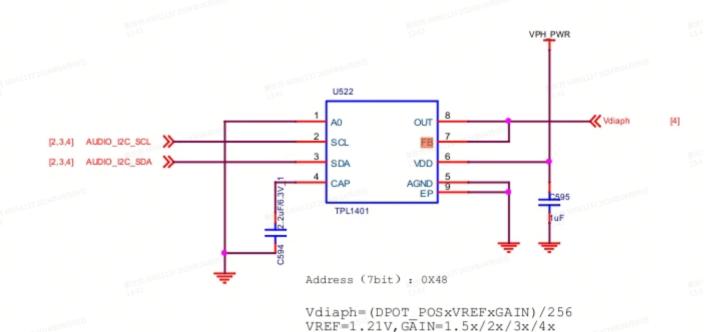

调试思路

由原理图知,并没有需要配置的gpio,TPL1401挂在QUP 0 SE0的I2C下;

TPL1401的引脚7输出电压到LP3318B5F的引脚3,我们通过写两个寄存器调试TPL1401的引脚7输出的电压达到电致变色效果;

- 1.把reg(GENERAL_CONFIG)的第2位REF_EN置1
- 2.根据最终电压需要,写reg(DPOT_POS)4-11位
- 3.根据最终电压需要,写reg(GENERAL_CONFIG)的0-1位

TPL1401原理图:

由图知: V=reg(DPOT_POS)/256*Vref*gain

7.6.2 GENERAL_CONFIG Register (address = D1h) (reset = 01F0h)

图 7-5. GENERAL_CONFIG Register

			—									c0067T3					
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		
RESERVED		DEVICE_ LOCK		RESERVED							DPOT	_PDN	REF_EN	OUT_	SPAN		
R-	0h	W-0h	161137 2024年04年	300		R-0F	-h		c00	51137 2024 ⁵	R/ V	V-2h	R/ W-0h	R/V	₩-0h		

gain由图7.6.2中reg(GENERAL CONFIG)的0-1位决定,00代表1.5,01代表2,10代表3,11代表4;

7.3.1.1.2 Internal Reference

The TPL1401 also contains an internal reference that is disabled by default. Enable the internal reference by writing 1 to REF_EN (address D1h). The internal reference generates a fixed 1.21-V voltage (typical). Using the OUT_SPAN (address D1h) bits, a gain of 1.5x, 2x, 3x, 4x can be achieved for the digipot output voltage (V_{OUT}) 方程式 2 shows digipot transfer function when the internal reference is used.

由7.3.1.1.2知, TPL1401的这种模式需要把reg(GENERAL CONFIG)的第2位REF EN置1;

7.6.4 DPOT_POSITION Register (address = 21h) (reset = 0000h)

表 7-15. DPOT_POSITION Register

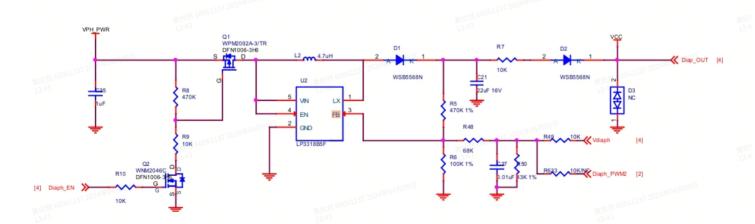

然 (3	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
		Χ	(DPOT_POS[7:0] - MSB Left aligned								Х		
	X-0h				2024年04月09	R/W-000h									X-0h	

由7.6.4知, reg(DPOT_POS)写4-11位, 范围0-255

根据计算,Vmax小于4.84V

LP3318B5F原理图:

Power For Diaphragm

由图知, R1=470K, R2=100K, 由以下公式:

$$V_{OUT} = \left(\frac{R_1}{R_2} + 1\right) \times V_{FB}$$

由电气特性表知: Vout的最大值为33V

电压调节使用方法

设置x在0-255之间,对应电压0-4.84V,最终输出对应14.73-2.8v

```
1 #define filename "/dev/tpl0"
2 #define CMD2 _IO(0x52,0x08)
 3 fd=open(filename, O_RDWR);
 4 ret = ioctl(fd, CMD2,x);
 6 /* x
